

# Datalynx DMS Solutions

## Enhanced Data Migration

The Datalynx DMS Enhanced Data Migration Hub is the most versatile solution for undertaking complex data migrations. With the DMS you can successfully transition data between disparate platforms, databases and environments via a proven, highly-automated and systematic approach.

In addition to the standard migration options you can take advantage of the DMS' extensive inbuilt data processing capabilities, including:

- Dataset consolidation to support the merging of business functions and retirement of legacy systems
- Data quality enhancement, transformation and standardisation to ensure your legacy data will work as expected in the new system.
- Master record creation and ongoing master data management.
- Archiving of historical data for subsequent analysis and reporting.

Incorporating optional data consolidation, data cleansing and data archiving, a Datalynx Data Migration Hub is a comprehensive solution for managing large datasets entering or leaving your systems.

The DMS Enhanced Data Migration Hub operates in conventional environments (on-premise), in the Cloud, in hybrid environments and across Clouds, to deliver solutions with the flexibility to cater for every business scenario.
